## ABSTRACT

With the growth of VR devices being more accessible to the masses, it is understood that environment, interactivity, and the ability to immerse oneself in a virtual world is a key factor in the success of any VR experience. However, achieving this experience is often difficult for many games due to lack of attention to interactivity and immersion. In order to combat this, our group seeks to develop a VR game that will use hand input to immerse a user in a quest-like game. To achieve immersion and interactivity we will use different tools and methodologies to help the player feel like they are apart of the experience.

## 1 INTRODUCTION

The game centers around a lone space traveler who is on a quest to collect different items to build an essential part. As they travel through different dimensions, the user will experience different terrains, forms of life, and interesting settings. This game will be broken up into four key areas of travel being: A desert, a forest, a village, and a farm. Each area's focus will allow us to give the user multiple cohesive experiences without the risk of throwing them off from the main story. This will also allow the developers to test different aspects of each environment to present the idea that a user truly traveled a different dimension.

Along with the environment, we seek to have non-playable character or NPC interaction that will make each space more lively and natural to the user. However, the main functionality and interactivity will be with the quests assigned in each area. The user will be able to collect items that relate to their respective quest and explore a majority of their environment to seek these out. Although it is simple, it can allow the user to immerse themselves without strenuous tasks breaking their immersion. The quests will be entirely focused on hand input allowing a user to pick up, examine, and collect objects with ease. The user will also be able to look around and navigate the each environment as naturally as possible.

## 2 RELATED WORK

Games that inspired the creation of this project are "The Witness" and "The Forest". "The Witness" uses environment and puzzle interaction in a seamless way. Integration of this in VR has translated well since the game was first published. By looking at how "The Witness" makes the environment the main aspect, it is something we want to take away from. Despite most if not all of the environment being in low poly 3D graphics, the use of ray tracing, saturated colors, and a lack of clutter makes the environment feel alive and natural. The game also uses a first person perspective which is something we want to take away from. The first person perspective allows for a more personal and intimate experience with the puzzles that is not often seen in VR games. There is more naturality with this view then with third person perspective.

"The Forest" also uses the previous aspects but in a more realistic and intense setting. The main aspects to take away from is the environmental interaction. Although "The Witness" achieves the appropriate aesthetic while integrating puzzles, "The Forest" is more realistic with its gameplay. Having the ability to interact with tools such as axes, sticks, and even a bow and arrow brings a lot into the immersion of the game. Movement becomes key in the gameplay which is translated through the well thought out head and hand tracking that makes every swing or flick feel meaningful in the environment the player is in. Since it is also a survival game, first person perspective brings out the sense of urgency with every interaction. The game also contains well thought out NPC interactions that are extremely heart racing in a VR environment. By seeing how "The Forest" uses interactivity in its gameplay we want to try and achieve that within our game through our collection quests. However, we want to keep the calmness and aesthetic found in "The Witness" to make the game more enjoyable.

## 3 METHODOLOGY

In order to complete the project, it will be done on Unity 2021.3.7f1. All testing will occur with the Oculus Quest 1 and the Oculus Quest 2. Each scene will utilize assets from the Unity Asset Store and any other source containing appropriate assets. The scenes will be connected through a main hub area which will contain teleportation pads to each area. The user will be able to teleport by standing on a pad and triggering a script or pressing a button. These portals will also be placed in each area in order to travel back to allow the user to have a choice on where to go. This will allow us to merge the scenes in a manner that fits with the story but also reduces any strenuous load times that may occur.

Outside of the hub being worked on, each group member will handle a scene and quest that corresponds with it. The scenes will be split as so:

- Desert: Melanie Vasquez
- Forest: Mark Blinder
- Village: Omar Hegazy
- Farm: Chethram Ramoutar

Interactivity will be integrated into each scene through the use of the XR rig and XR Interaction Toolkit. This rig will allow for VR testing due to the headset detection built into it and controller support allowing us to add eye and hand detection. Along with that, the use of the XR Device Simulator will help with non-vr testing to take place throughout the debugging process since we can tweak any features without the full need of a VR headset. The XR Interaction Toolkit will allow for the user to interact with objects in the scene by using their hands or eyes and will help us with the main portion of the interactivity. Since we are using hands as the main input device, having this allows us to test and enhance interaction experience with either haptic feedback or visual feedback. This can help build upon

each scene once we get into NPC interactions as well and ways the user can have the illusion of communication within each area.

Outside of the interactivity, for immersion we will use assets and different light and rendering techniques to allow a user to be in a space that is not dull. Animations will also be used because it can give the illusion of movement which can add life to each scene. These animations may be applied to the collected objects, the NPCs, or even the environment itself but overall the main focus is NPC animations. This can be done through Mixamo and scripts that trigger certain movements within a player model.

#### **ACKNOWLEDGMENTS**

The authors wish to thank A, B, and C. This work was supported in part by a grant from XYZ.
